# The Hottest 3 Letters in Generative AI Right Now Are Not LLM

**TIS**  
MEETING OF MINDS

**RAG**

**stands for Retrieval  
Augmented Generation**

**TIS**  
MEETING OF MINDS

## **Here is why?**

- 1. An AI model is only as good as what it's taught**
- 2. An off-the-shelf LLM is not always up to date, nor will it have trustworthy access to your data or understand your customer relationships**

**Do you agree?**

**Solution?**

**Use RAG**

RAG is an AI technique that allows companies to embed their most current and relevant proprietary data directly into their LLM prompt

And we're not just talking about structured data like a pdf document or a relational database

We mean retrieving **all available data**, including unstructured data and other types of information that could lead to a **better AI output**

# TIS NEXT GEN BOTS

An AI LLM solution that will utilize information from any documentation (e.g. policies & procedures, prospects, catalogues etc...) and answer specific questions related to it

ChatGPT

MISTRAL  
AI\_

# TIS NEXT GEN BOTS

TIS AI LLM solution helps you retrieve and use your data from various internal sources for better generative AI results

**Bottom line:**  
**You can trust the responses to be relevant and more accurate**

Because the source material comes from your own trusted data, it helps reduce or even eliminate hallucinations and other incorrect outputs

According to Article 21 of the Pravilnik o radu, an employee is entitled to a paid leave of up to six months from the beginning of the

According to article 37 of the given PDF file, the maximum duration of overtime work of an individual employee is 10 hours per year.

An AI developer in TIS designs, develops, implements, maintains, and updates applications and software in the field of artificial intelligence. He is responsible for developing the architectural solutions, collaborating with other developers and analysts to achieve business goals and analyzing the results. He is also responsible for implementing optimized models, improving the performance of the models, working closely with teams for development and testing, and integrating models into software. Additionally, he performs other tasks as assigned by the Director of the company.

Izvešće o stanju vinograda - kvalitativno zoniranje

**Templateović vina**

**19.08.2023.**

### 3. IZVJEŠĆE

#### 3.1 Kvadratna slika

Slika 3.2: opis slike

### 4. ZAKLJUČAK

Iz navedenih snimanja i analiza može se zaključiti kako je prisutna određena varijabilnost u bujnosti (vigoru) unutar analiziranih vinograda, a pripremljene karte zona mogu služiti za kvalitativno zoniranje i selektivnu berbu na razini pojedinog položaja, vinograda ili sorte, ali i za razmatranje ciljanog provođenja agrotehničkih mjera, prvenstveno u ujednačavanju karakteristika tla u vinogradu s ciljem smanjenja varijabilnosti i potencijalnog povećanja prinosa i kvalitete u idućim godinama.

U izvješću su navedene preporuke za selektivnu berbu temeljem spektralnih podataka i treba imati na umu da su podaci „grupirani“ i da su moguća odstupanja na razini trsred, odnosno da unutar zone manje bujnosti može biti i nekoliko trsova ili dijelova vinograda koji su više bujni, no u pravilu generalizirani podaci daju prilično točnu sliku stanja zona bujnosti, a time i zona kvalitete, koje su obrnuto proporcionalne (veća bujnost, „niža“ kakvoća grožđa). Nadalje, kao što je i navedeno, termini „viša“ i „niža“ kakvoća odnose se na sadržaj šećera i kiselina te potencijalnu količinu prinosa (a sve vezano uz bujnostvigor). Ti termini ovise i o želji proizvođača za proizvodnju određenog tipa vina (mirno vino, pjenušavo vino, svježe vino, zrelije vino) te se u tom slučaju i termini kakvoće mogu promatrati obrnuto („niža“ kakvoća može dati izvrsno grožđe za proizvodnju laganijih svježih vina ili pjenušavih vina). Dakle, termin kakvoće treba promatrati u kontekstu proizvodnje grožđa prema potrebama proizvođača za proizvodnju određenih kategorija vina.

Kako se na više lokacija nalaze vinogradi koji su zasađeni istim sortama, a spektralne podatke nije moguće „usporediti“ međusobno, već ih je potrebno sagledati kao „trenutne“ vrijednosti koje opisuju stanje vegetacije u određenom vinogradu tako su i izrađene kvalitativne zone (sukladno izmjerenim podacima).

Sve ove analize su potpora odlučivanju samog vinogradara, kako bi se, uz egzaktno izmjerene podatke, detektirale razlike u kvalitativnom potencijalu vinograda i omogućila selektivna berba prema cilju proizvodnje
